

AI STRATEGY

Gross retention dropped. CS team grew 40%. **The math broke.**

AI agents fix the architecture. Outcome-based pricing makes it pay back.

THE PROBLEM

Why CS models fail at scale

- Product-led growth flooded self-serve tiers no CSM covers
- Self-serve churn runs 22% vs. 9% for named accounts
- Fully loaded US CSM cost crossed \$250K in 2025
- Quarterly renewals demand sub-24-hour churn signals

THE SHIFT

Agents are a profit pool play

- Pattern recognition across every account simultaneously
- Churn risk surfaces before the customer goes quiet
- Expansion signals CSMs would otherwise miss
- Outcomes the agent produces become priceable units

REAL NUMBERS

31% churn cut in 9 months

- 1,800 customers, \$42M ARR before deployment
- Net revenue churn: 14.2% down to 9.8%
- Self-serve churn fell from 22% to 12%
- Gross retention climbed from 88% to 93%

THE PRICING PLAY

Outcomes become new revenue

- Premium Success tier: \$40K-\$120K per year
- 38% of mid-market customers adopted in 6 months
- \$4.2M net new ARR added by month nine
- \$720K deployment cost, \$6.3M first-year return

COVERAGE COMPARED

What changes at 100% coverage

- Manual CS covers only 30-40% of the customer base
- Tool-assisted platforms reach 50-60% at best
- Agentic layer monitors every account, every signal
- Cost per account drops from up to \$9K to under \$700

HOW IT WORKS

Three signals, one reasoning layer

- Churn risk: flagged before accounts go quiet
- Expansion: usage patterns trigger timely AE alerts
- Intervention: right playbook routed to the right tier
- Every agent action is logged and auditable

IMPLEMENTATION

Sequence agents into SMB fir

- Over-automation kills enterprise relationships
- Deploy into SMB and mid-market tiers first
- Build the data layer before the reasoning layer
- Outcome-based pricing follows reliability, not the reverse

Size your churn pickup.

We run your retention metrics and show you what a nine-month agentic deployment looks like for your customer mix.
