

ADTECH AI AGENTS

Bidding, creative, attribution: **agents in 2026.**

Swipe →

THE ADTECH PROBLEM

Human traders can't match agent speed.

- Programmatic bidding at microsecond scale
- Creative ops bottlenecked by manual iteration
- Attribution models wrong by design at last-click
- Signal fragmentation across 50+ data sources

BIDDING AUTOMATION

Agents bid at speed humans can't match.

- Micro-budget optimization at impression level
- Dynamic bid adjustment from real-time signal
- Frequency cap enforcement without platform lag
- ROAS optimization across channels simultaneously

CREATIVE OPS

Faster creative: agents generate variants.

- Copy variant generation at scale from brief
- A/B test setup automated from performance history
- Asset refresh triggered by fatigue signal detection
- Creative scoring before any spend is committed

ATTRIBUTION MODELS

Multi-touch attribution that actually works.

- Last-click ignores 6-12 preceding touchpoints
- Agent-driven Shapley attribution across full funnel
- Incrementality testing automated and continuous
- Attribution model updated from closed-loop outcome data

DEPLOYMENT RESULTS

Real numbers from AdTech deployments.

- 18-26% improvement in ROAS from agent bidding
- Creative refresh cycle cut from 3 weeks to 3 days
- Attribution accuracy improvement of 30-40% vs last-click
- Analyst time shifted from reporting to strategy

DATA REQUIREMENTS

What agents need to perform.

- First-party data as the foundational signal layer
- Clean cross-channel event stream with timestamps
- Closed-loop conversion data within 48 hours
- Incrementality test history for model calibration

WHAT FAILS

Agent pitfalls in programmatic buying.

- Agents without spend guardrails over-bid on noise
- Creative automation without brand safety constraints
- Attribution models without incrementality testing
- Bidding agents that can't explain their decisions
