

ENTERPRISE AI DEPLOYMENT

From pilot to production: 2026 playbook.

Swipe →

THE PILOT TRAP

Proof of concept is not production.

- POC ran on synthetic data with three internal users
- Board approved based on a 30-minute demo
- CTO asked for a production roadmap in week seven
- Compliance team had not seen the architecture yet

THE 5 PRODUCTION GATES

Every enterprise deployment clears 5.

- Gate 1: compliance architecture review passed
- Gate 2: audit trail signed off by controls team
- Gate 3: reviewer escalation tested under load
- Gate 4: security review and penetration test complete
- Gate 5: staged rollout with rollback plan approved

GOVERNANCE FIRST

Governance is not a phase.

- Embed compliance from week one, not week ten
- Define audit trail requirements before writing agent logic
- Reviewer escalation paths designed with operations team
- Cross-functional ownership documented at kickoff

STAGED ROLLOUT MODEL

How regulated firms ship incrementally.

- Stage 1: read-only agent on internal data only
- Stage 2: output suggestions with mandatory human review
- Stage 3: straight-through on low-risk segments with sampling
- Stage 4: full automation on approved segments only

MONITORING REQUIREMENTS

Production agents need active monitoring.

- Decision accuracy against a hold-out sample
- Escalation rate as a health indicator
- Model drift detection with alert thresholds
- Audit trail completeness score tracked weekly

TIMELINE REALITY

5 months vs 12: what changes it.

- Compliance embedded week 1: 5-month timeline
- Compliance embedded week 8+: 12-month timeline
- Single clear owner: 5 months. Shared ownership: 12 months
- Security review started early: no delay at gate 4

FAILURE PATTERNS

Why 59% never reach production.

- Governance designed after architecture: kills compliance gate
- POC scope creep without production requirements defined
- Security review treating agent as generic software
- No rollback plan: board won't approve staged launch
