

FINTECH LENDING AI

Credit decisioning with agents: **real numbers.**

Swipe →

THE LENDING CHALLENGE

Rules handle policy. **Agents handle data.**

- Credit policy logic needs deterministic rules
- Document extraction is where agents add value
- Underwriting bottleneck is data assembly, not decisioning
- Explainability requirements constrain black-box models

AGENT USE CASES

Where agents unlock lending ops.

- Income document extraction and normalization
- Bank statement analysis for cash flow verification
- Payroll verification across multiple provider formats
- Automated credit memo drafting from structured data

CREDIT DECISIONING SPLIT

Separate the logic from the data work.

- Deterministic rules for credit policy application
- Agents for document processing and data extraction
- Human underwriter for policy exceptions and edge cases
- Explainable output at every stage for fair lending audit

DEPLOYMENT RESULTS

Measured outcomes from live deployments.

- 60-75% reduction in underwriting cycle time
- Document extraction accuracy above 94% on standard forms
- Underwriter capacity increased 3-4x without additional hires
- Decisioning consistency improved vs manual review variance

COMPLIANCE LAYER

Fair lending requires explainability.

- Every adverse action with documented basis
- Consistent factor application across demographic groups
- Audit trail readable by CFPB examiners directly
- Model risk management documentation built into pipeline

WHAT FAILS

Pitfalls in lending automation.

- Agents making credit decisions without policy guardrails
- Black-box models that can't produce adverse action notices
- Document extraction without human review on exceptions
- Automation that increases fair lending audit risk

IMPLEMENTATION PATH

From pilot to production in 90 days.

- Phase 1: document extraction only (lowest risk)
- Phase 2: data normalization and credit memo drafting
- Phase 3: automated decision support with underwriter review
- Phase 4: straight-through processing for low-risk segments
