

SAAS CUSTOMER SUCCESS

Cut churn with AI agents: real numbers.

Swipe →

THE PROBLEM

You can't scale manual churn signals.

- CSMs miss 40-60% of early churn indicators
- Reactive playbooks fire after damage is done
- Seat-based pricing means no margin for deep CS ops
- Manual health scores update weekly at best

HOW AGENTS HELP

Agents monitor health. You act on insight.

- Continuous product usage signal monitoring
- Behavioral drift detection before drop-off
- Auto-triggered outreach at inflection points
- Escalation routed to CSM only when needed

CHURN SIGNAL TYPES

Leading signals beat lagging ones.

- Login frequency and session depth drop
- Feature adoption stall in core workflow
- Support ticket sentiment shift
- Integration errors going unresolved

EXPANSION REVENUE

Agents surface upsell timing.

- Usage ceiling detection triggers upgrade prompt
- Multi-seat candidates flagged from power user data
- Timing-based outreach: right moment, not random
- Expansion revenue tracked as agentic output

REAL DEPLOYMENT NUMBERS

Outcomes from production deployments.

- 18-34% reduction in logo churn in 12 months
- 2.3x increase in CSM-to-account ratio coverage
- Payback inside 6 months for teams above 500 accounts
- Expansion revenue up 28% from signal-triggered outreach

WHAT FAILS

Generic alerts don't drive action.

- Alerting without recommended next action
- Signals that fire too late to recover
- Playbooks that don't match account segment
- No feedback loop from outcome to model

ARCHITECTURE PATTERN

The stack that ships in 60 days.

- Product telemetry as agent input layer
- Lightweight LLM reasoning over usage signals
- CRM integration for playbook execution
- Human CSM as final approver, not first responder
