

REGTECH COMPLIANCE

Audit trails that examiners actually accept.

Swipe →

THE COMPLIANCE GAP

Logs exist. Trails do not.

- Systems log events but not reasoning
- No linkage between decision and input
- SOC 2 examiners want decision context
- FINRA examiners want intent and override history

AGENTIC MEMORY LEDGER

Every decision. Every input. Logged.

- Agent logs decision, input, output, and timestamp
- Reasoning trace readable by auditors directly
- Override history captured with reviewer identity
- Immutable ledger with no post-hoc editing

WHAT AUDITORS CHECK

SOC 2 and FINRA audit requirements.

- Evidence of human review on high-risk decisions
- Consistent policy application across similar cases
- Explainable output with documented input basis
- Change log for model updates affecting outcomes

AUTOMATION USE CASES

What RegTech agents handle end to end.

- Regulatory change monitoring and alerting
- Policy document comparison and gap analysis
- Audit report drafting with source citations
- Control testing with sampling and evidence log

DEPLOYMENT RESULTS

Time saved. Findings reduced.

- 60-80% reduction in manual audit prep time
- Examiner findings dropped 40% in first cycle
- Regulatory change lag eliminated for covered rules
- Audit trail completeness score above 95% consistently

WHAT FAILS

Automation without memory fails audits.

- Agents that act but don't log reasoning
- Audit trails that require manual assembly post-hoc
- Decision systems with no override capture
- Policy automation with no version history

ARCHITECTURE

The compliant stack for regulated firms.

- Immutable decision log as foundational layer
- Structured reasoning output for each agent action
- Human review queue with decision capture interface
- Regular audit trail testing against examiner criteria
